Curing operating system blindness

A long time ago...

In Dog Years

- macOS is the only first class citizen
- Commercial management tool
- Unmanaged Windows VM available
- What's security?

Not so long ago...

We found our way

- macOS is our single focus
- Munki is implemented
 - Established Patching SLA
- Source control is implemented
 - Global Visibility
 - Code Review
 - Cross Team Function
- Strong focus on Security

What are we trying to achieve?TM

- Keep Airbnb's, our host's and our guest's information secure
- Enable Airbnb employees to be productive

What tools do we have?

What tools do we have?

- **Munki** Software updates
- **Crypt** FileVault key escrow
- **Sal** Reporting
- **Puppet** Configuration management
- **microMDM** DEP / Bootstrapping

And then we bought a company

**“Hey, guys.... How do you feel about
managing Windows?”**

**“Just give them a
Mac”**

“Just give them a Mac”

- We don't have processes to manage another platform
- We don't have time to manage another platform
- We don't *want* to manage another platform

Their entire product was built on a Microsoft stack

Financey software

A close-up shot of a man in a dark military uniform. He is wearing a peaked cap with a silver skull emblem on the front. He has a serious expression and is looking slightly to his left. The background is dark and out of focus. A thin, light-colored rope or cord is visible on the right side of the frame.

Are we the baddies?

Be a host

We need to support Windows

Let's Yabba-Daba

macOS

Patching (Munki)
Configuration (Puppet)
FileVault (Crypt)
Reporting (Sal)
MDM (microMDM)

Windows

Patching (??)
Configuration (Puppet)
BitLocker (??)
Reporting (??)
MDM (??)

How do we do it on a mac?

Install a Certificate

```
define certificates::root (  
  String $source,  
  String $sha1,  
  String $trust_level = 'trustRoot',  
)
```

A Certificate is pretty simple on a mac

It takes a source, a sha1, and a trust level

```
certificates::root { 'My Internal Cert':  
  source      => "puppet:///modules/internal_certs/my_cert.crt",  
  sha1        => '5bc875fa06f5105b36f0913f199ce98e67d24895',  
  trust_level => 'trustRoot'  
}
```

How does it look on Windows?

What did you expect?

```
sslcertificate { "mycert.crt":  
  name      => 'mycert.crt',  
  password  => 'password123',  
  location  => "${::facts['puppet_vardir']}/certificates",  
  thumbprint => upcase($sha1)  
}
```

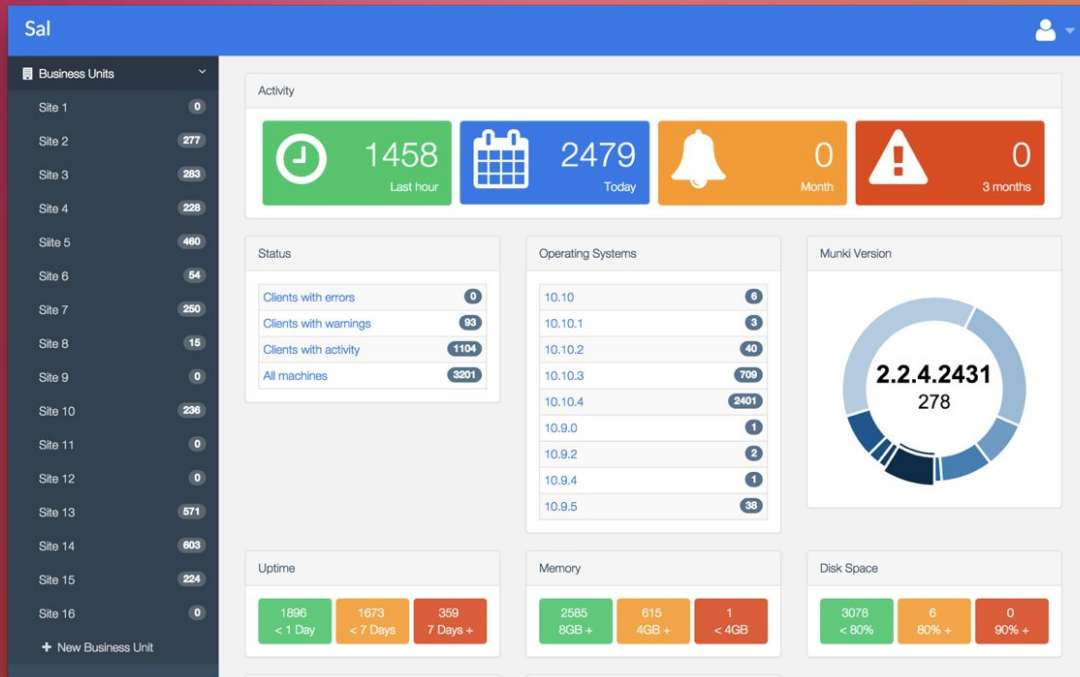

- Windows and Mac have the same implementation on the surface
- Providers handle the OS specifics under the hood
- The properties of a certificate don't change between Operating Systems

Stop offering the OS
Start offering the service

IF A CLIENT DOESN'T
CHECK IN

DOES IT EXIST?

Gosal

A Windows Client for Sal

- Powershell exec
- Go Struct
- POST Request

github.com/airbnb/gosal

But... We have a third operating system

Chrome OS

Why Chrome OS?

- No more imaging / provisioning
- Built in patching
- Verified Boot
- Decent devices are really cheap

**But you can only do what Google lets you,
right?**

Apps

Extensions

JavaScript APIs

Chrome provides extensions with many special-purpose APIs like `chrome.runtime` and `chrome.alarms`.

Stable APIs

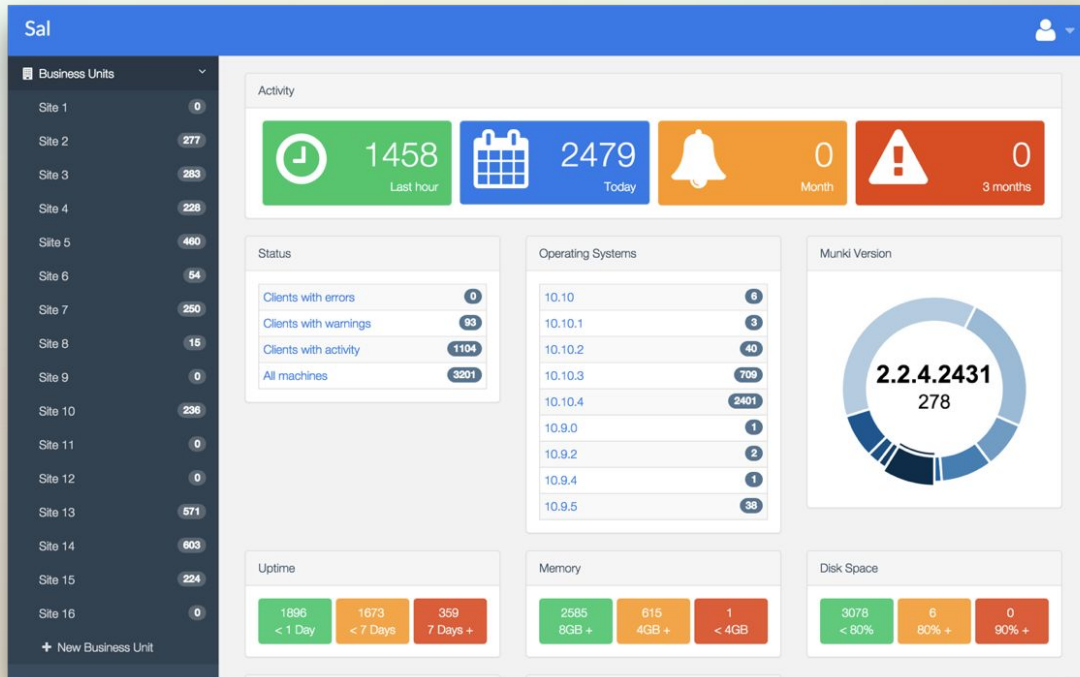

Contents[Stable APIs](#)[Beta APIs](#)[Dev APIs](#)[Experimental APIs](#)[API conventions](#)

| Name | Description | Since |
|---------------------------------------|--|-------|
| accessibilityFeatures | Use the <code>chrome.accessibilityFeatures</code> API to manage Chrome's accessibility features. This API relies on the ChromeSetting prototype of the type API for getting and setting individual accessibility features. In order to get feature states the extension must request <code>accessibilityFeatures.read</code> permission. For modifying feature state, the extension needs <code>accessibilityFeatures.modify</code> permission. Note that <code>accessibilityFeatures.modify</code> does not imply <code>accessibilityFeatures.read</code> permission. | 37 |
| alarms | Use the <code>chrome.alarms</code> API to schedule code to run periodically or at a specified time in the future. | 22 |
| bookmarks | Use the <code>chrome.bookmarks</code> API to create, organize, and otherwise manipulate bookmarks. Also see Override Pages , which you can use to create a custom Bookmark Manager page. | 19 |
| browserAction | Use browser actions to put icons in the main Google Chrome toolbar, to the right of the address bar. In addition to its icon , a browser action can also have a tooltip , a badge , and a popup . | 19 |

ChromeSal

- graham.at/chromesal
- github.com/salopensource/chromesal
- Requires Sal 3.3.0

What's next?

Package management for Windows

Windows package management

- An army of helpdesk people to install things by hand
- Chocolatey Enterprise
- Munki for Windows?

Managing Chrome OS is GUI based
